

## Control Your Site's Systems in an Emergency

If an emergency strikes, can you instantly broadcast emergency instructions throughout your site via the communications devices you already own? With Metis Secure's E-CIM system, you can.

E-CIM stands for Emergency Communications Information Management. The E-CIM platform enables you to take immediate control of your site's existing communications devices in a crisis—and broadcast urgent, actionable voice instructions that give your people the information they need to protect themselves.

The system is powered by Metis Secure's E-CIM software, connected to your site's existing computer screens, IP phones, PA systems, email servers, digital signs, and almost any other analog or digital communications device.

When you're confronted with an emergency, you can instantly take control of the communications devices throughout your building or site, and surround your people with urgent, impossible-to-ignore emergency directives:

- Sirens and emergency voice directives instantly begin sounding through PA speakers and IP phones.
- Emergency alerts take over computer screens, IP phone screens, and digital signs throughout your facilities.
- Alerts go to pre-designated groups via text and email—either through a third-party email/text service, or via your own email server.

## Powerful, Customized Emergency Alerts

The E-CIM software includes a host of customized, pre-recorded Instant Alerts that you specify, based on your emergency threat profile and your response plans. In a crisis, you can broadcast alerts and instructions to your people in seconds.

The software also includes a powerful custom alert engine, for the emergency situations you can't plan for ahead of time. Using advanced text to speech technology, you can rapidly broadcast specific, actionable instructions for any emergency.

In both cases, emergency directives automatically repeat throughout your facility for a specified period of time, reinforcing emergency instructions and reducing confusion.

## Flexible System Operation

The Metis Secure E-CIM system is flexible and future-proof. It's customized for your needs, and is designed to easily grow with you over time. Several typical options are listed below. If you have a need that you don't see here, just ask—the system is almost infinitely adaptable.

- **Activate through a browser, mobile device, or automatically**—You can activate the Metis Secure E-CIM system in whatever way is best for you. Options include launching alerts through any internet browser, from on-site or off, or launching alerts from mobile phones or tablets. The system can also connect to a wide variety of sensors and data feeds, and can alert your site automatically if a dangerous situation is detected.
- **Host the server on-premises or with an off-site hosting service**—The Metis Secure E-CIM system is hosted on a server, so you can access it from anywhere. The server can be hosted by a third party off-site, or it can reside on-premises.
- **Arm your people with panic buttons**—If you have or need panic buttons, the E-CIM system easily ties them in—when someone at your site presses a button, the system instantly alerts designated responders and reports the location of the person in need.
